Overview and Instructional Sequence

The Climate Change Curriculum integrates geospatial inquiry based web and laboratory activities designed for a middle school learners. Assessments, teacher educative materials and rich teacher and student scaffolding provide a complete set of curricular materials for 21 days.

Posttest

Climate Change is a technology-supported middle school science inquiry curriculum. This curriculum focuses on essential climate literacy principles with an emphasis on weather and climate, Earth system energy balance, greenhouse gases, paleoclimatology, and how human activities influence climate change. Students use geospatial information technology tools (Google Earth), Web-based tools (including an interactive carbon calculator and geologic timeline), and inquiry-based lab activities to investigate important climate change topics. **Climate Change** is aligned to the *Essential Principles of Climate Literacy* in addition to national science and environmental education standards.

Climate Change has been pilot tested in urban middle school classrooms. Materials best used with the Firefox Web Browser and Google Earth version 5.2 or higher.

ELI is sponsored in part by the Lehigh Environmental Initiative. This material is based upon work supported by the Toyota USA Foundation.

Instructional Sequence

The instructional sequence is a recommended instructional sequence. This sequence has been field-tested in 8th grade urban classrooms in three different tracked levels. We recognize that the ability levels of students will range significantly across different locations and some classrooms may complete activities faster or slower than what we have listed as the recommended time frame. We recognize that different teachers may feel the need to provide summative assessment quizzes or additional review activities at specific points during the instructional sequence. Such activities will vary across different teachers and classroom contexts.

We have not recommended specific homework assignments for each day in the instructional sequence. We recognize that the assignment of homework will vary significantly across each classroom based on the philosophy of teachers and school districts. We have noted suggested supplemental readings on specific days that can be assigned for homework. These are PDF documents that can be accessed by students on the Climate Change Student Resource page or reproduced and distributed as hard copies. The completion of student worksheets may also be assigned as homework. We also encourage teachers to assign journaling activities and concept mapping activities as homework to help students review the main unit concepts.

Student instructional handouts and teacher support materials are provided in both MS Word and PDF formats. **Student handouts can be modified to provide additional supports and step-by-step instructions by adding text passages from the teacher versions of select handouts.**

Click on the links below to access a detailed instructional sequence for each day that includes student resources (Google Earth files, videos, and images), instructional handouts, and teacher curriculum support materials.

Although this site is designed to be cross-platform, we recommend the use of the Mozilla Firefox Web browser.

Day 1 - Pretest. Introduction to Climate Change unit. Students will complete the climate change unit content knowledge pretest assessment.

Day 2 - Investigating Weather and Climate with Google Earth. Students will use Google Earth to explore global temperature changes. They will use Google Earth to determine how the temperature of the Earth has changed during a recent 50 - 58 year period. They will also explore, analyze, and interpret climate patterns of 13 different cities, and analyze differences between weather and climate patterns.

Day 3 - Earth Systems and Atmosphere. Students will be introduced to the four main Earth spheres (atmosphere, lithosphere, hydrosphere, and biosphere) and the structure and composition of the atmosphere. Students will also understand the different roles that ozone plays in the troposphere and the stratosphere.

Day 4 - Atmospheric Gases. Students will explore the variety and ratio of compounds and elements that make up the Earth's atmosphere. They will understand volumetric measurements of gases in the atmosphere and visually depict the composition of the atmosphere.

Day 5 - Greenhouse Gases. Students will be introduced to the major sources of greenhouse gases. Students will understand that greenhouse gases are produced by both natural and anthropogenic (man-made) sources.

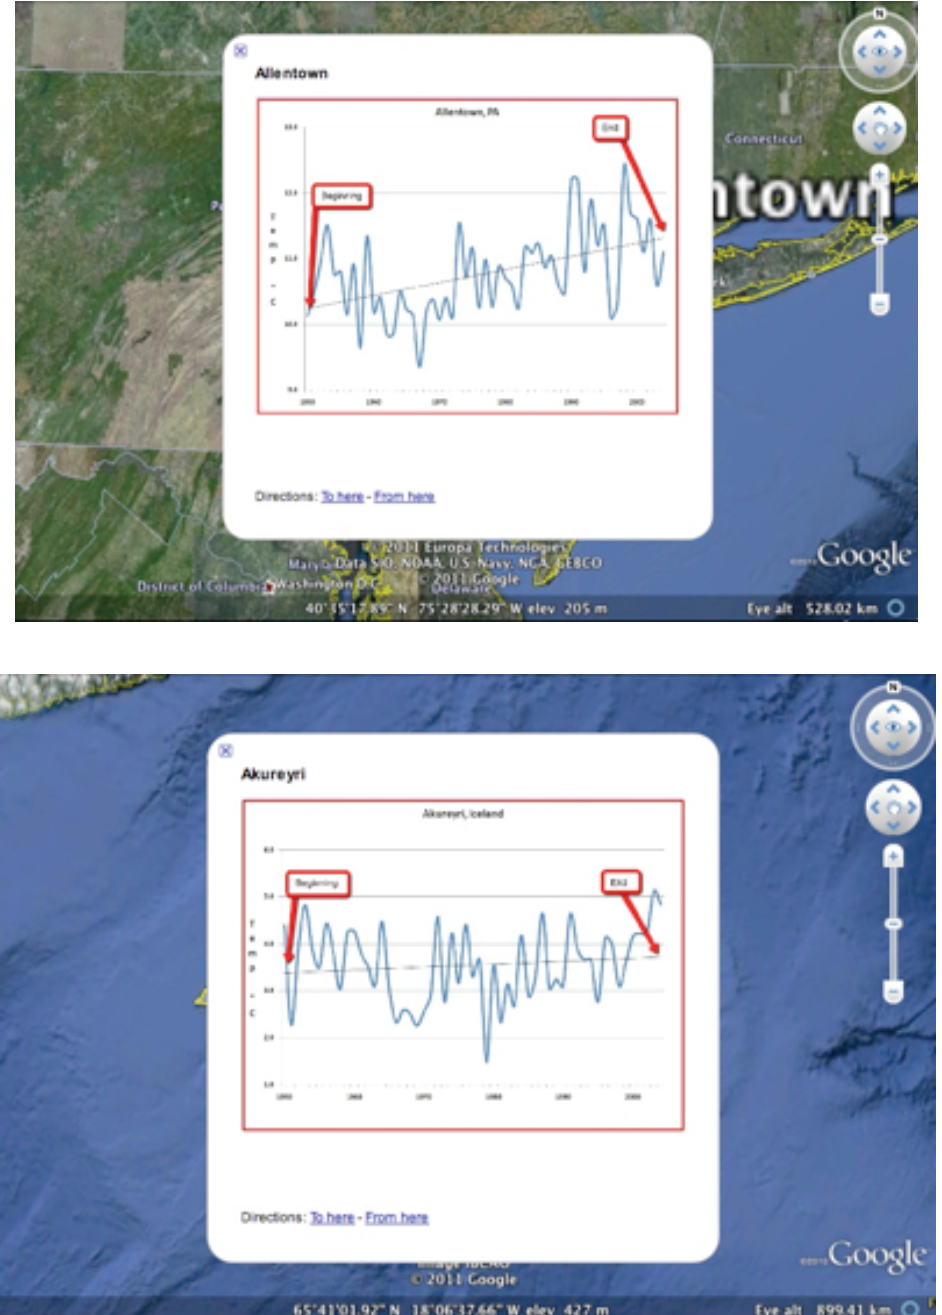

Day 6 - Investigating Albedo. Students will be introduced to the effect of albedo on surface temperatures. Students will observe the change in surface temperature as dark and light surfaces are exposed to light energy. Students will understand how light reflection and absorption are related to albedo. Students will understand that lightly colored surfaces have higher albedo than darker colored surfaces.

Day 7 - Planetary Energy Balance. Students will understand that different Earth materials (water and sand) have different heat capacities. Students will learn about key processes involved with planetary energy balance including surface and atmospheric absorption and reflection.

Day 8 - Planetary Energy Balance. Students will understand how the angle of incoming solar radiation affects the climate of the Earth.

Example Activities

Day 2 - Investigating Weather and Climate with Google Earth. Students will use Google Earth to explore global temperature changes. They will use Google Earth to determine how the temperature of the Earth has changed during a recent 50 - 58 year period. They will also explore, analyze, and interpret climate patterns of 13 different cities, and analyze differences between weather and climate patterns.

Analysis Questions

Formative Assessment

Weather and Climate Student Investigation Sheet Assessment

Answer

1. Which city has the highest maximum average annual temperature?

Answer: Phoenix

2. Which city has the lowest minimum average annual temperature?

Answer: Phoenix

3. Which city is farthest from the equator?

Answer: Phoenix

4. Which city is closest to the equator?

Answer: Phoenix

5. Which two cities have had the greatest amount of climate change over the last 50 years?

Answer: Beijing and Phoenix

6. Which four cities have had the least amount of climate change over the last 50 years?

Answer: Moscow, New York, London, and Tokyo

7. Look at a 10-year period on the Las Vegas climate graph. How does a 10-year weather pattern differ from a 50-year climate pattern?

Answer: The 10-year climate pattern changes about 1.5 °C over the 50-year period. The weather of Las Vegas for a 10-year period fluctuates with many average annual temperature readings that are higher and lower than the 50-year climate pattern.

8. How is a 10-year period on the Las Vegas climate graph different from a 10-year period on the Moscow climate graph?

Answer: The average annual temperature in Moscow has greater fluctuations (or variability) over a 10-year period compared to the average annual temperature in Las Vegas.

9. How is weather different than climate?

Answer: Weather refers to a specific time and place, such as today's weather. Climate refers to a longer time frame, greater than 30 years. Climate changes occur much more slowly than weather changes.

Interesting fact: Beijing may include a large heat island effect.

Formative Assessment

4. Record the length, width, and area of the continuous ice sheet from the three time periods below. Do not take into account the decimal points. Record whole numbers only.

(Answers will vary depending on students' length and width measurement locations. A range of possible answers is presented below.)

Year	Length (km)	Width (km)	Area (km ²)
1979	2880 - 3494	2581 - 3788	7,433,280 - 13,235,272
1990	2900 - 3000	2463 - 3913	7,142,700 - 11,739,000
2010	2807 - 3073	2150 - 2784	6,0350,050 - 8,555,232

5. Analyze the continuous ice sheet area between 1979 and 2010. Are the ice sheets growing, melting, or staying about the same? Support your claim with evidence. What do you think is causing this to occur?

Answer: The ice sheets are melting. The continuous ice sheet area has been reduced in size between 1979 and 2010. This is likely due to increased atmospheric temperatures which have helped to melt the ice sheets.

Assessment Items Aligned to Misconceptions

EXAMPLES OF ITEM ANALYSIS: CLIMATE CHANGE CONTENT ASSESSMENT

N=900
Total score reliability (Cronbach's alpha) for the total assessment was 0.713

Pearson Correlation:
** significant at the 0.01 level (2-tailed)
* significant at the 0.05 level (2-tailed)

1. Climate is defined as weather patterns that change on a scale of at least a few...

A. weeks. n = 396 (40.0%)

B. months. n = 254 (27.7%)

C. years. n = 209 (21.1%)

D. decades. n = 129 (13.0%)

NO ANSWER n = 2 (0.2%)

Item Difficulty: 0.13
Item Discrimination: 0.224**

2. Geological processes such as ice cores are used to measure...

A. past climates. n = 391 (39.5%)

B. future climates. n = 247 (24.9%)

C. future weather. n = 201 (20.3%)

D. current weather. n = 149 (15.1%)

NO ANSWER n = 2 (0.2%)

Item Difficulty: 0.39
Item Discrimination: 0.444**

10. How are changes in weather different from changes in climate?

A. Climate changes only occur in northern latitudes. n = 78 (7.9%)

B. Weather changes refer to time periods greater than 30 years. n = 116 (11.7%)

C. Climate changes occur much more slowly than weather changes. n = 628 (63.4%)

D. Weather changes are greater near the equator than in northern latitudes. n = 164 (16.6%)

NO ANSWER n = 4 (0.4%)

Item Difficulty: 0.63
Item Discrimination: 0.466**

The graph above shows the change in carbon dioxide (CO₂) concentration in the atmosphere.

29. Describe at least four different types of human activities that are causing the long-term increase of carbon dioxide levels over the last 100 years? Be specific.

Question/Criteria	Exemplary (4)	Proficient (3)	Adequate (2)	Needs Improvement (1)	Insufficient Response (0)
Question 29: Part A Describe at least four different types of human activities that are causing the long-term increase of carbon dioxide levels over the last 100 years? Be specific.	All listed activities are identified with clear illustration, specific examples. Student examples: <input type="checkbox"/> Cutting down trees for farmsteads <input type="checkbox"/> Using coal or natural gas to create electricity <input type="checkbox"/> Keeping the heat turned up too high <input type="checkbox"/> Leaving too many lights on <input type="checkbox"/> Driving too much <input type="checkbox"/> Not recycling <input type="checkbox"/> Cooking <input type="checkbox"/> Burning fossil fuels <input type="checkbox"/> Not recycling <input type="checkbox"/> Electricity <input type="checkbox"/> Deforestation <input type="checkbox"/> Air pollution <input type="checkbox"/> Using gasoline in cars <input type="checkbox"/> Leaving lights on appliances on <input type="checkbox"/> Industrial farming <input type="checkbox"/> Heating and cooling homes, etc. <input type="checkbox"/> Energy wastages	At least half of the listed activities are identified with general examples but lack sufficient detail. AND No student responses are in the Needs Improvement category. Student examples: <input type="checkbox"/> Not recycling <input type="checkbox"/> Cooking <input type="checkbox"/> Burning fossil fuels <input type="checkbox"/> Not recycling <input type="checkbox"/> Electricity <input type="checkbox"/> Deforestation <input type="checkbox"/> Air pollution	Activities are vague but accurate. Student examples: <input type="checkbox"/> Household energy <input type="checkbox"/> Transportation <input type="checkbox"/> Trains, cars, planes <input type="checkbox"/> Food consumption <input type="checkbox"/> Agriculture/farming <input type="checkbox"/> Lights <input type="checkbox"/> Breathing <input type="checkbox"/> Using too much energy we don't <input type="checkbox"/> Not enough conservation <input type="checkbox"/> Pollution	Activities are ambiguous and include misunderstandings. Student examples: <input type="checkbox"/> Nuclear energy <input type="checkbox"/> Machinery <input type="checkbox"/> Household things <input type="checkbox"/> Construction <input type="checkbox"/> Over population <input type="checkbox"/> Global warming <input type="checkbox"/> War <input type="checkbox"/> Year <input type="checkbox"/> Littering	Student did not address components of question.

Results

The pre- and post-test Climate Change Knowledge Assessment data were organized and sorted to include only those students who had completed both assessments. Correct responses were tallied for the items. Paired-sample t-test analyses were conducted to compare the pre- and post-test results. The results of these analyses were used to compare overall gains as well as ability level track groups. Overall results regarding the use of the Climate Change curriculum showed significant improvement in urban middle school students' understanding of climate change concepts. Effect sizes were large (ES>.8) and significant (p<.001) for the entire assessment and for each ability level subgroup.

Overall Climate Change achievements by ability and track for Pre/Post Test. N=109

	Pretest Mean (SD)	Posttest Mean (SD)	t-Value	Effect Size
Overall (N=107)	8.91 (3.00)	12.17 (3.40)	10.676*	1.21
Low Track (N=34)	7.44 (2.38)	10.32 (2.87)	3.55*	1.20
Middle Track (N=44)	8.75 (2.65)	12.00 (2.90)	7.05*	1.23
Upper Track (N=29)	10.86 (3.17)	14.59 (3.32)	7.031*	1.17
